Appendix C - Probes and Agents

Agents and Systems

The following tables list the **MyLab** probes and the recommended cleaning, disinfection and sterilization agents and systems.

The tables show both chemical (and physical) compatibility and biological effectiveness of the method.

NOTE

The listed products may not be available in all regions. For probe availability, please contact your local representative; for cleaning, disinfectant or gel availability, contact the cleaning agent or gel manufacturer.

OK means the use of the agent/system is permitted.

N means the use of the agent/system is not permitted.

- means the agent/system has not been tested.

CAUTION

Do not use not tested agents/systems either to clean or to disinfect or to sterilize the probe. The probe could be damaged if such agents are used.

Cleaning, disinfection and sterilization are allowed up to the immersible part limit.

NOTE

Any damage caused by the use of not recommended agents/systems is not covered by the warranty.

WARNING

The listed disinfection/sterilization agents and systems are recommended because of chemical compatibility with the probe materials.

The tables in the next pages indicate which agents/systems have been positively tested for chemical compatibility only. Follow the guidelines and

recommendations of the manufacturer for the biological effectiveness of agents/systems.

Use of solutions other than those referenced is not recommended. They may damage the probe housing or the acoustic lens. Esaote takes no responsibility for damage caused by using non-approved products.

Follow the instructions provided by the manufacturer of the agent for proper use. Observe specifically soak times and dilution rates.

Overexposure to the disinfection fluid can damage the probe.

Personnel should adopt all necessary protective measures during the probe cleaning, disinfection and sterilization processes (for example gloves, protective glasses).

Never attempt to clean or disinfect the probes while they are connected to the system.

The probes have resulted compatible, in terms of chemical aggression, with reprocessing agents/methods listed in the tables below for average use of at least 7 years corresponding to not less than 4000 cycles. For sterilization, compatibility test evaluation is limited to 100 cycles.

In any case reprocessing methods are harsh and can shorten the life of the equipment owing to many unpredictable factors.

Equipment that undergoes reprocessing should be checked regularly.
